

# Design Progress Report 2

20 April 2018

Data Processing Fall 2018

Jacob Jasper, Amerens Jongsma, Julia Jelgerhuis, Lennert Jansen, Simon Kemmere

*Number of mass shootings per state*

Colored density map of mass shooting. This will provide an overview of the number of mass shootings per state in the past 50 years. We can use this graph to correlate the amount of shootings per state with another dataset, for example mental health issues or educational level per state.

### *Locations of all mass shootings in the USA in the last 50 years per state*

This graph will give us more information about the precise locations of the mass shootings. It will help us map the shootings, and map the states where more shootings occur than other states. We could look why some states have more shootings, by looking at motive behind shootings or gun laws in states.

*Bar chart number of deaths per state*

Another way to visualize deaths per state. A bar graph of deaths per state could give us a better overview of the major differences per state.

## # of Deaths Statewise vs # of Shootings Statewise

*Line graph overlapping a barchart producing an overview of deaths versus shootings statewise.*

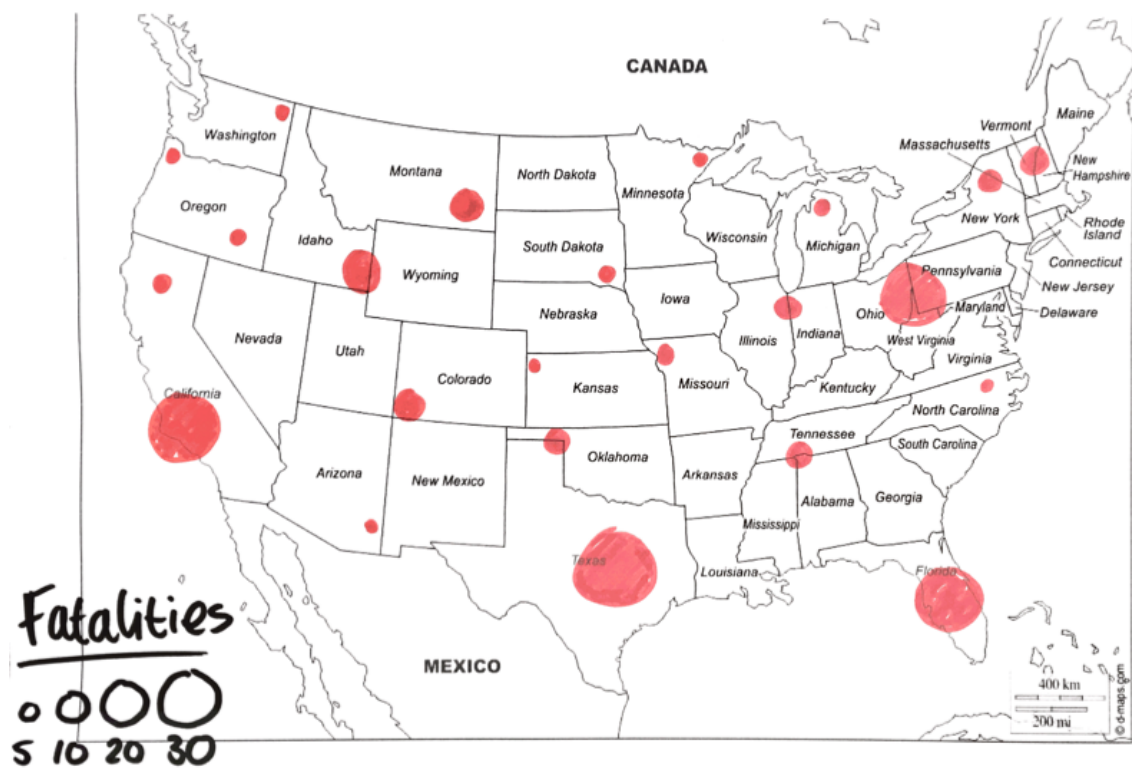

This chart will help us determine whether the number of shootings correlate with the number of deaths in these shootings. Visualizing whether a low amount of shootings will amass to a high number of casualties in a state or that a large amount of shootings will result in a relatively low amount of deathly casualties, or something in between.

## Deaths in the US by gun violence (rate / 100.000 inhabitants)

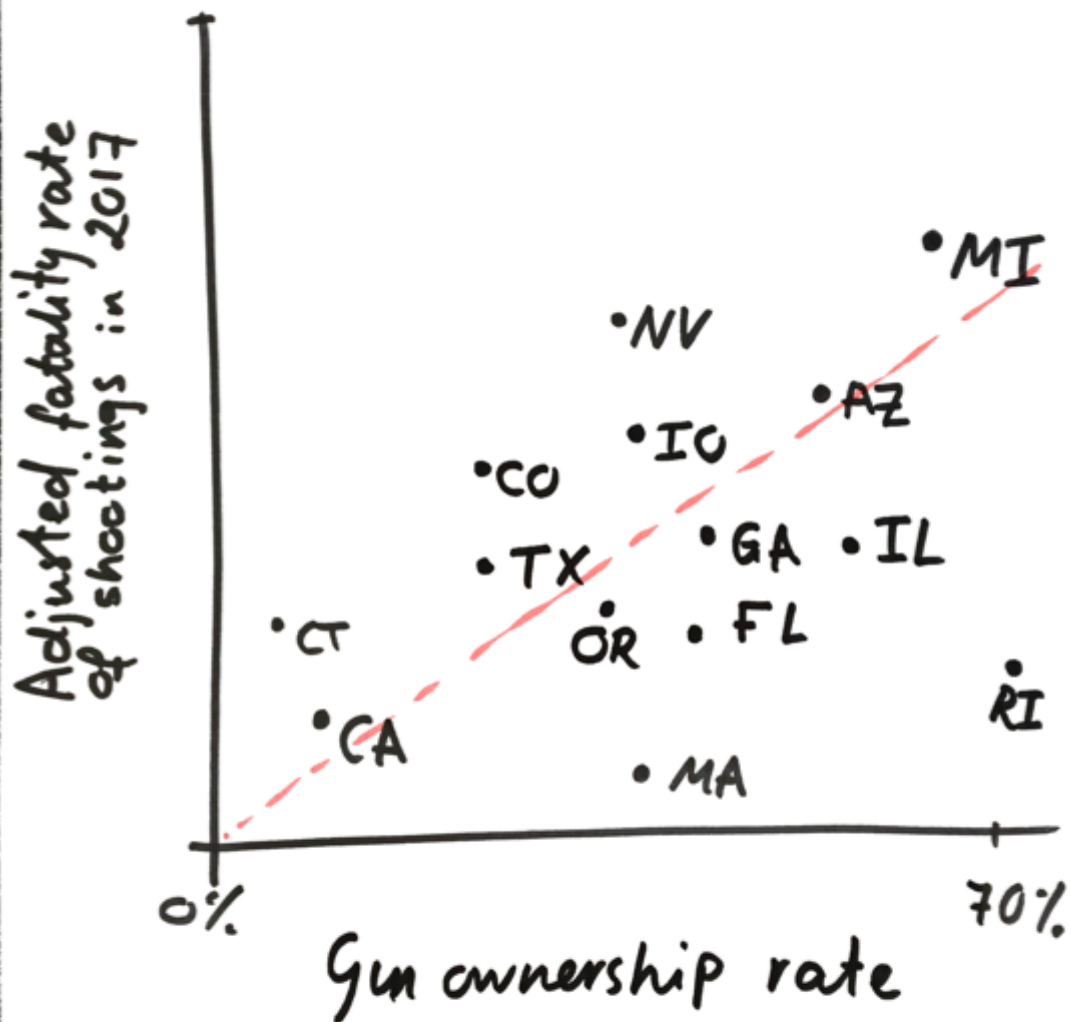

*Line graph plotting the number of deaths by gun violence in the USA.*

Showing whether a trend in deaths by gun violence can be discovered. If there is indeed a trend, demographic or any other viable explanation can shed light on why this could be the case.

Scatter plot of gun ownership rate  
vs. fatality rate by state

## Motive behind mass shootings
